# PROJETO INTEGRADOR

## Adicionando TypeScript a um

1. Adicione plug-ins TypeScript, tipos e ESLint ao seu projeto.

npm Fio

```
npm install -D @tsconfig/react-native @types/jest @types/react @types/react-test-renderer types
```

### OBSERVAÇÃO

Este comando adiciona a versão mais recente de cada dependência. As versões podem precisar ser alteradas para corresponder aos pacotes existentes usados pelo seu projeto. Você pode usar uma ferramenta como o [React Native Upgrade Helper](#) para ver as versões enviadas pelo React Native.

# PROJETO INTEGRADOR

2. Adicione um arquivo de configuração TypeScript. Crie um `tsconfig.json` na raiz do seu projeto:

```
{  
  "extends": "@tsconfig/react-native/tsconfig.json"  
}
```

3. Renomeie um arquivo JavaScript para ser `*.tsx`

Você deve deixar o `./index.js` arquivo de ponto de entrada como está, caso contrário, poderá ter problemas ao agrupar uma compilação de produção.

4. Execute `yarn tsc` para verificar o tipo de seus novos arquivos TypeScript.
